```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent.

WO200061151-A2

```
The invention relates to novel immunogenic CpG oligodeoxynucleotides CG (AAC80581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5-NNNT-CpG-WNNN-3' or 5-RY-CpG-RY 3'. The central CpG motif is unmethylated, and the oligonucleotides optionally have phosphorothicate linkages which make them more resistant to degradation. The invention also relates to an oligonucleotide delivery complex. The oligonucleotide of the invention and a targetting agent, and a pharmaceutical composition comprising the oligonucleotide delivery complex. The oligonucleotides are able to induce either a cell-mediated (T-cell) response or a humoral (B-cell, antibody) response, with coligonucleotides of the sequence 5'-RN-CpG-RN-3' being able to induce a humoral response or a humoral lesoponse. It is thought that after administration, the oligonucleotide acts on antigen-presenting cells cannot an accordance of natural killer (RN) cells. A cell-mediated or humoral response and dendritic cells), which then release cytokines, leading to activation of natural killer (RN) cells. A cell-mediated or humoral response is useful for treating, preventing or ameliorating an allergic reaction (preferably activation of ranductions of ranductions which may be treated include viral, the allergic conditions which may be treated include viral, conditions, and the infections which may be treated include viral, conditions which may be treated include viral, conditions, and the infections which may be treated include viral, conditions, and the infections which may be treated include viral, conditions, and the infections which may be treated include viral, conditions, and the infections which may be acted in combination with an anti-allergence of conditions, and the infections which may be acted in conditions and protozoal infections exposure to an agent of an incliment gestome is used in the treatment of an autoimment disorder (e.g., uppus exposure to an agent of biological warfare. An immunogenic cpg conditions of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    lymphocytes ex vivo, producing activated lymphocytes which are then administered to the host. The present sequence represents an immunogenic CpG oligodeoxynucleotide of the invention

The invention relates to novel immunogenic CpG oligodeoxynuclectides (AAC80581-C80723). The oligonuclectide are at least 10 bases long and comprise one of the generic sequences 5'-RNNT-CpG-WNNN-3' or 5'-RY-CpG-RY optionally have phosphorothioate linkages which make them more resistant to degradation. The invention also relates to an oligonucleotide delivery complex comprising an oligonucleotide of the invention and a targetting agent, and a pharmaceutical composition comprising the oligonucleotide delivery complex. The oligonucleotides are able to induce either a cell-delivery complex. The oligonucleotides are able to induce either a cell-delivery complex and those of the sequence 5'-RY-CpG-RY-3' being able to induce a humoral response. It is thought that after administration, the oligonucleotide acts on antigen-presenting cells cell-mediated response and dendritic cells), which then release cytokines, leading to activation of natural killer (NK) cells. A cell-mediated or humoral response is useful for treating, preventing or ameliorating an allergic reaction (preferably asthma), or an infection, where an immunogenic CpG oligonucleotide is administred either alone or in combination with an anti-allergenic agent or anti-infectious agent. Thinitis, hayfever, urticaria, food allergies and other atopic conditions which may be treated include eczema, allergic conditions which may be treated include viral, thingal and protozoal infections enduction may also be includent and protozoal infections enduction may also be includent and protozoal infections enduction and conditions which may be treated include or high conditions which may be treated include viral, thingal and schistosomiasis Immune response induction and conditions which may be treated include or high conditions which may be treated or high conditions which may be trea Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent. used in the treatment of an autoimmune disorder (e.g., lupus erythematosus, rheumatoid arthritis and multiple sclerosis), a disease associated with immune system deficiency, and symptoms resulting from exposure to an agent of biological warfare. An immunogenic Cpd oligonuclectide, either alone or in combination with an anti-cancer agent, is useful for treating solid tumour cancer. The induction of an immune response is used in antisense therapy and to improve the efficacy immune response is used in antisense therapy and to improve the efficacy present sequence represents an immunogenic of a vaccine. The oligonucleotide is preferably administered to lymphocytes ex vivo, producing activated lymphocytes which are then administered to the host. The present sequence represents an immunog CpG oligodeoxynucleotide of the invention ; 0 100.0%; Score 20; DB 4; Length 20; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel immunogenic CpG oligodeoxynucleotides (AAC80581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5'-NNT-CpG-WNN-3' or 5'-RY-CpG-RY-3'. The central CpG motif is unmethylated, and the oligonucleotides optionally have phosphorothioate linkages which make them more resistant to degradation. The invention also relates to an oligonucleotide delivery complex comprising an oligonucleotide of the invention and a targetting agent, and a pharmaceutical composition comprising the oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent.
              oligonuclectide, either alone or in combination with an anti-cancer agent, is useful for treating solid tumour cancer. The induction of an immune response is used in antisense therapy and to improve the efficacy of a vaccine. The oligonuclectide is preferably administered to the host. The present sequence represents an immunogenic CPG oligodeoxynuclectide of the invention
                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                      ö
exposure to an agent of biological warfare. An immunogenic CpG
                                                                                                                                                                                                                DB 4; Length 20;

The invention relates to novel immunogenic CpG oligodeoxynuclectides (AACG0581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5'-NNNY-CpG-WNNN-3' or 5'-RY-CpG-RY -3'. The central CpG motif is unmethylated, and the oligonucleotides of optionally have phosphorothicate linkages which make them more resistant to degradation. The invention also relates to an oligonucleotide delivery complex. The oligonucleotide of the invention and a targetting an oligonucleotide of the invention and a targetting complex complex. The oligonucleotides are able to induce either a cell-coligonucleotides are able to induce either a cell-mediated response, and those of the sequence 5'-RN-CpG-RY-3' being able to induce a humoral response. It is thought that after administration, the oligonucleotide acts on antigen-presenting cells cell-ministration, the oligonucleotide acts on antigen-presenting cells administration, the oligonucleotide acts on antigen-presenting cells cell-ministration of natural killer (MX) cells. A cell-mediated or humoral response is useful for treating, preventing or antionating on them occur by activation of T- or B-calls. The humoral response is useful for treating, preventing or an immunogenic Cgo oligonucleotide is administered either alone or the allergic conditions which may be treated include escama, allergic conditions, and the infections which may be treated include viral, conditions, and protozoal infections encount of exposure to an agent of anti-intections and evidence or the ishmania and solisosomiasis. Immune response induction may also be expensed in the infections which may be treated include escama, allergic conditions, and protozoal infections encount of an agent of an autoimmune disorder (e.g., lupus erythematosus, rheumatoid arthritis and multiple sclerosis), a disease conditions, and protozoal infections with an ani-incliment of an agent of an actoimmune response is used in alone or in combination with an ani-incliment and experience of a vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms allergies, cancer, and autoimmune disorders and resulting from exposure to a bio-warfare agent.

Claim 4; Page 30; 46pp; English.

The invention relates to novel immunogenic CpG oligodeoxynucleotides CAR80581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5.*NNNT-CpG-WNNN-3' or 5.*RX-CpG-RY -3. The central CpG motif is unmethylated, and the oligonucleotides optionally have phosphorothioate linkages which make them more resistant to degradation. The invention also relates to an oligonucleotide delivery complex comprising an oligonucleotide of the invention and a targetting agent, and a pharmaceutical composition comprising the oligonucleotide delivery complex. The oligonucleotide of the invention and a targetting agent, and a pharmaceutical composition comprising the oligonucleotide delivery complex. The oligonucleotides are able to induce either a cell.

Cc delivery complex. The oligonucleotide are able to induce either a cell.

Cc delivery complex. The sequence 5.*RY-CpG-RY-3' being able to induce a cell-mediated response or a humoral response. It is thought that after cell-mediated response and dendritic cells), which then release cytokines, cell-mediated or immunogenic contral killer (RN) cells. A cell-mediated or humoral response can then occur by activation of T- or B-cells. The induction of an immune response is useful for treating, preventing or amolioration of an immune response is useful for treating, preventing or amolioration with an anti-allergenic agent or anti-infectious agent. The allergic conditions which may be treated include eczema, allergic conditions which may be tr lymphocytes ex vivo, producing activated lymphocytes which are then administered to the host. The present sequence represents an immunogenic CpG oligodeoxynucleotide of the invention immune response is used in antisense therapy and to improve the efficacy of a vaccine. The oligonucleotide is preferably administered to erythematosus, rheumatoid arthritis and multiple sclerosis), a disease associated with immune system deficiency, and symptoms resulting from exposure to an agent of biological warfare. An immunogenic CpG oligonucleotide, either alone or in combination with an anti-cancer agent, is useful for treating solid tumour cancer. The induction of an

Oligodeoxynucleotides for inducing an immune response to treat and prevent an allergic reaction, cancer, an autoimmune disorder and symptoms resulting from exposure to bio-warfare agents, comprise multiple CpG весперв

Claim 5; Page 39; 48pp; English.

nucleotides comprising multiple configurations, where one of the configuration multiple configuration, where one of the configuration is equences is different from another of the multiple CpG sequences. The cobm are useful for inducing an immune response, preferably a cell-mediated immune response, involving non-B cell activation, inherferon gamma (IRV-gamma) production or a humoral immune response involving B cell activation, an inferior inferior in a host, for treating, preventing or ameliorating an allergic reaction, e.g. solid tumour cancer, a disease associated with the immune cancer, e.g. solid tumour cancer, a disease associated with the immune or system deflicancy, infection or a symptom resulting from exposure to bio-warfare agent in a human. The induction of immune response improves the efficacy of a vaccine and is used in antisense therapy. The ODN are useful for treating, preventing or coryza, hay fever, bronchial asthema, urticaria (hives), food allergies and other atopic conditions, for improving the efficacy of vaccines and acther atopic conditions, for improving the efficacy of vaccines malaria, for treating immune system defliciency virus (HIV) and malaria, for treating immune system defliciency are rheumatonia and autorimument immunodician, e.g. lupus error errors. AAS09551-AAS09662 represent oligodeoxynucleotides (ODN) of at least 10 nultiple sclerosis, infections including Francisella, schistosomiasis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AASO9551-AASO9662 represent oligodeoxynucleotides (ODN) of at least 10 nucleotides comprising multiple CpG sequences, where one of the CpG sequences is different from another of the multiple CpG sequences. The ODN are useful for inducing an immune response, preferably a cellmediated immune response, involving non-B cell activation, interferon gamma (IFN-gamma) production or a humoral immune response involving B cell activation, antibody and interleukin-6 production in a host, for treating, preventing or ameliorating an allergic reaction, e.g. asthma, cancer, e.g. solid tumour cancer, a disease associated with the immune system e.g. autoimmune disorder or an immune system deficiency, infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligodeoxynucleotides for inducing an immune response to treat and prevent an allergic reaction, cancer, an autoimmune disorder and symptoms resulting from exposure to bio-warfare agents, comprise multiple CpG sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 IEN-gamma; humoral; antibody production; interleukin-6 production; therapeutic; allergy; asthma; cancer; autoimmune disorder; infection; bio-warfare; vaccine; antisense therapy; eczema; allergic rhinitis; coryza; hay fever; urticaria; hives; food allergy; atopic condition; hepatitis; human immunodeficiency virus; HIV; malaria; Francisella; lupus erythematosus; rhematoid arthritis; multiple sclerosis; schistcsomiasis; tuberculosis; acquired immunodeficiency syndrome; AIDS; Leishmania; Ebola; Anthrax; Listeria; ss.
and other atopic conditions, for improving the efficacy of vaccines against hepatitis A, B and C, human immunodeficiency virus (HIV) and malaria, for treating immune system deficiencies, e.g. lupus erythematosus and autoimmune diseases such as rheumatoid arthritis and multiple sclerosis, infections including Francisella, schistosomiasis, tuberculosis, acquired immunodeficiency syndrome (AIDS), Leishmania and symptoms resulting from exposure of bio-warfare agent, including Bbola,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence; immune response; non-B cell activation; interferon gamma;

Oligodeoxynucleotides for inducing an immune response to treat and prevent an allergic reaction, cancer, an autoimmune disorder and symptoms resulting from exposure to bio-warfare agents, comprise multiple CpG Bequences

Claim 5; Page 34; 48pp; English.

AASO9551-AASO9662 represent oligodeoxynucleotides (ODN) of at least 10 nucleotides comprising multiple CpG sequences, where one of the CpG sequences is different from another of the multiple CpG sequences. The ODN are ueeful for inducing an immune response, preferably a cell-mediated immune response, involving non-B cell activation, interferon

call activation, antibody and interleukin-6 production in a host, for treating, preventing or ameliorating an allergic reaction, e.g. asthma, cancer, e.g. solid tumour cancer, a disease associated with the immune system e.g. autoimmune disorder or an immune system deficiency, infection or a symptom resulting from exposure to bio-warfare agent in a human. The induction of immune response improves the efficacy of a vaccine and is used in antisense therapy. The ODN are useful for treating, preventing or ameliorating allergic reactions, including eczema, allergic rhinitis or coryza, hay fever, bronchial asthma, urticaria (hives), food allergies and other actopic conditions, for improving the efficacy of vaccines against hepatitis A, B and C, human immunodeficiency virus (HIV) and malaria, for treating immune system deficiencies, e.g. lupus crythematosus and autoimmune diseases such as rheumatoid arthritis and multiple sclerosis, infections including Francisella, schistosomiasis, tuberculosis, acquired immunodeficiency syndrome (AIDS), Leishmania and symptoms resulting from exposure of bio-warfare agent, including Ebola, gamma (IFN-gamma) production or a humoral immune response involving B Anthrax and Listeria

                                                                                                                                               The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1. .20

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytckines: It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease, heparitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Bbola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      *tag= a /nctionally thymidine is replaced by uracil to /note= "optionally thymidine is finked to at least one other base through a ribose sugar"
                                                                                                                      New immunostimulatory compositions comprising RNA/DNA hybrid oligonuclectides, useful for enhancing an immune response or inducing cytokines, particularly for treating diseases, e.g. cancer, allergy or HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA/RNA hybrid; phosphorothioate backbone; immunostimulatory; vaccine; infection; allergy; cancer; hypersenaitivity; bio-warfare; immunostimulant; antiallergic; cytostatic; antimicrobial; anti-HIV; immunosuppressive; protozoacide; virucide; hepatotropic; gene therapy; antinflammatory; antibacterial; ss.

WPI; 2002-130570/17.

New immunostimulatory compositions comprising RNA/DNA hybrid obligonuclectides, useful for enhancing an immune response or inducing cytokines, particularly for treating diseases, e.g. cancer, allergy or HIV infection.

Example 11; Page 61; 68pp; English.

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic thinitis, hay fever or food allergies), Lyme disease, heparitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/note bB16 library was generated by sequenced clones. The BB16 library with 4000 previously sequenced clones. The BB16 library was contributed by the Soares laboratory and it was constructed and normalized as described by Bonome Research 6(9): 791-806. RNA was prepared from dissected brains of adult worker bees of
          BB170025B20H07.5 Bee Brain Normalized/Subtracted Library, BB17 Apis mellifera cDNA clone BB170025B20H07 5', mRNA sequence.

rubrisubablicans, Vector: pSport1; Site 1: Sal1; Site 2:
Not1; An unidirectional cDNA library generated from
[seedlings inoculated with Herbaspirilum
rubrisubablicans]. ODNA was prepared from poly4+ mRNA
using SuperScript Plasmid System Kit (Invitrogen). The
double-strand cDNAs were fractionated in a sepharose
CL-28 40cm-columns and fragments sizing between 0.8 and
1.5 Kb were directionally cloned into the vector. Details
of each source of RNA and library construction can be
obtained at http://sucest.lad.ic.unicamp.br/public"

/note="Vector: pBluescript SK-; Site_l: EcoRI; Site_2:
XhoI; cDNA was prepared from polyA+ enriched RNA. The cDNA
was directionally ligated into the Unizap XR vector from
Stratagene and packaged using Giapack III Gold packaging
extracts. Plasmids containing CDNA inserts were excised
from the recombinant lambda-Zap phage using Ex-assist
helper phage and propagated in SOLR cells."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

Sequence 11388, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

APPLICANT: Homburger et al.

TITUE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster:

FILE REFERENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: PatentIN Ver. 2.0

SEQ ID NO 11388

LENGTH: 2255
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 26956, Application US/09270767

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 32,

```
The invention relates to novel immunogenic CpG oligodeoxynucleotides CAACGO581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5-NNNY-CpG-WNNN-3' or 5-RY-CpG-RY -3'. The central CpG meutif is unmethylated, and the oligonucleotides optionally have phosphorotchicate linkages which make them more resistant to degradation. The invention also relates to an oligonucleotide delivery complex. The oligonucleotide of the invention and a targetting agent, and a pharmaceutical composition comprising the oligonucleotide delivery complex. The oligonucleotides are able to induce a threat a cell-mediated response, and those of the sequence 5'-NNYT-CpG-WNNN-3' colligonucleotides are able to induce a mucral response, and those of the sequence 5'-NNYT-CpG-WNNN-3' being able to induce a mucral response and dendritic cells, which then release cytokines, leading to activation of natural killer (NK) cells. A cell-mediated or induction of natural killer (NK) cells. A cell-mediated or induction of natural satisfaction of T- or B-cells. The chuncral response can then occur by activation of T- or B-cells. The chuncral response can then occur by activation of T- or B-cells. The chuncral response is useful for treated in compliantion with an anti-allergatic agent or anti-infectious agent. Cr conditions, and the infections which may be treated include eczema, allergic conditions which may be treated include erzema, allergic conditions which may be treated include event, and conditions, and protozoal infections encounts of the allergic conditions which may be treated include event, and conditions, and protozoal infections exponse induction may also be captured with immune system deficiency, and symbolic may also be cused in the infections which may be treated include events. The allergic conditions which may be treated include events of the elements of an agent of an inclument of an agent of an incombine response is used in an agent of biological warfare. An immunogenic CpG elements is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       lymphocytes ex vivo, producing activated lymphocytes which are then administered to the host. The present sequence represents an immunogenic CpG oligodeoxynucleotide of the invention

AASO9551-AASO9662 represent oligodeoxymucleotides (ODN) of at least 10 nucleotides comprising multiple CpG sequences, where one of the CpG sequences is different from another of the multiple CpG sequences. The CpG sequences is different from another of the multiple CpG sequences. The CpM are useful for inducing an immune response, preferably a cell-cpm compared involving an electron of ammune response involving B cell activation, antibody and interleukin-6 production in a host, for treating, preventing or ameliorating an allergic reaction, e.g. asthma. Cc treating, preventing or ameliorating an allergic reaction, e.g. asthman. Cc ancer, e.g. solid tumour cancer, a disease associated with the immune system e.g. autoimmune disorder or an immune system deficiency, infection or a symptom resulting from exposure to bio-warfare agent in a human. The induction of immune response improves the efficacy of a vaccine and is induction of immune response improves the efficacy of a vaccine and is coryza, hay fever, bronchial asthma, urticaria (hives), food allergies and other atopic conditions, for improving the efficacy of vaccines coryza, hay fever, bronchial asthma, urticaria (hives), food allergies and other atopic conditions, for improving the efficacy of vaccines capainst hepatitis A, B and C, human immunodeficiency virus (HIV) and cmalaria, for treating immune system deficiencies, e.g. lupus corrections including Pranciscia arthritis and cmiltiple sclerosis, infections including Pranciscial, schistosomiasis, tuberculosis, acquired immunodeficiency syndrome (AIDS), Leishmania and symptoms resulting from exposure of bio-warfare agent, including Boola, and historia

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytckines. It can be useful for enhancing an immune response treating diseases, including pathogenic infection, (non-)malignant trumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                     New immunostimulatory compositions comprising RNA/DNA hybrid oligonucleotides, useful for enhancing an immune response or inducing cytokines, particularly for treating diseases, e.g. cancer, allergy or HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    infection; allergy; cancer; hypersensitivity; bio-warfare; immunostimulant; antiallergic; cytostatic; antimicrobial; anti-HIV; immunosuppressive; protozoacide; virucide; hepatotropic; gene therapy; antiinflammatory; antibacterial; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic thinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of

                                                                                                                                                                                                                                                                                                          The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and an DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergie (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                   inducing

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytchines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                       inducing

The invention describes a vaccine comprising one or more epitopes of a Paramyxoviridae F protein, and one or more CpG (cytosine followed by guanine linked by phosphate bond-oligodideoxynucleotides (ODNs). The vaccine is useful for vaccinating a patient especially against viruses of the Paramyxoviridae family e.g. respiratory syncytial virus (RSV), the primary cause of viral bronchiolitis and pneumonia in infants and children, and infectious pulmonary disease in infants. RSV has been particularly implicated in death of infants that are premature, have bronchopulmonary dysplasia, or congenital heart conditions. This sequence represents an oligodideoxynucleotide that can be used in the creation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oligodeoxynucleotide; dendritic cell; tumour; immunotherapy; vaccine; ostatic; immunostimulant; gene therapy; ss.
                                                                                                    Vaccine for immunizing patient against respiratory syncytial virus, has epitopes of Paramyxoviridae F protein, and cytosine followed by guanine linked by phosphate bond-oligodideoxynucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CpG oligodeoxynucleotide D29 used for dendritic cell maturation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                             comprises at least one oligonation is useful for enhancing both an RNA region and or inducing cytokines. It can be used as a vaccina adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or conon, or carcinomas and sarcomash, autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies), Lyme diseases, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or amalioranting the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to an immunostimulatory composition, which

                                                                                                                    cell.
Generating mature dendritic cells for tumor immunotherapy or as vaccines for activating the immune system to treat diseases such as cancer, comprises contacting a dendritic cell precursor with a D type oligodeoxynucleotide.
                                                                                                  The present sequence is that of D type CpG oligodeoxynucleotide D29, which is used in a claimed method for generating a mature dendritic cell. The method involves contacting a dendritic cell precursor, especially a monocyte, with the oligonucleotide. The method is useful for generating mature dendritic cells and enhancing T cell responses, thus enhancing antigen presentation. Mature dendritic cells are useful for tumour immunotherapy, for augmenting an immune response to an infectious agent or to a vaccine, and as vaccines to prevent future infection or to activate the immune system to treat diseases such as cancer. D class CpG ODN sequence useful for encapsulating in SSCL, DV29.

(first entry)

27-AUG-2003

ACC83118;

```
The invention relates to sterically stabilised cationic liposomes (SSCL) which comprises a cationic lipid, a co-lipid stabilishing agent and encapsulating a K type oligodeoxynucleotide (ODN) including a CDG motif. The invention is useful in pharmaceutical composition for impairing growth of a solid tumour cell (e.g. human tumour cell) bearing an immune response, which is expression of a cytokine (e.g. interferon gamma), particularly immunotherapeutic response against tumours or stimulating an in vivo or minune cell, and for inducing an immune response against an infectious agent e.g. virus, bacteria and fungus. It is also useful for a phivering oligodeoxynucleotides including a CDG motif in clinical caplications if or treating infectious diseases (e.g. tularemia, malaria, francisella, schistosomiasis, tuberculosis and leishmaniasis), cancer (e.g. solid tumours, AIDS-associated Kaposi's tumour, thyroid cancer cetc, allergy (e.g. eccema, allergic rhinitis or coryza, hay fever, bronchial or allergic asthma, unticaria, food allergies), autoimmune diseases (e.g. diabetes, rheumatoid arthritis, lupus erythematosus and
                                                                                                                                              Sterically stabilised cationic liposome; SSCL; ODN; oligodeoxynucleotide; tuberculosis; oytokine; leishmaniasis; AlDS-associated Kaposi's tumour; thyroid; cancer; allergy; eczema; allergic rhinitis; coryza; hay fever; schistosomiasis; interferon gamma; lupus erythematosus; antimicrobial; schistosomiasis; interferon gamma; lupus erythematosus; antimicrobial; CpG motif; interleukin-13; cytostatic; tularemia; rheumatoid arthritis; multiple sclerosis; infection; tumour; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cationic liposome composition for delivering oligodeoxynucleotides including a CpG motif in clinical applications, comprises a cationic lipid, a co-lipid, stabilizing agent and an encapsulated oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Puri
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Joshi BH,

                                                                                                                                                                                                                                                                                                                                                                                                               15-MAY-2003.
```

The present sequence is that of a CpG oligodeoxynucleotide of the invention. A claimed method for generating dendritic cells involves contacting a dendritic cell precursor, especially a monocyte, with a D type oligodeoxynucleotide (see ACC48294) containing a central unmethylated CpG motif. The method is useful for generating mature pendritic cells and enhancing T cell responses, thus enhancing antigen presentation. Mature dendritic cells are useful for immunotherapy, for augmenting an immune response to an infectious agent or to a vaccine,

Generating mature dendritic cells for tumor immunotherapy or as vaccines

The invention is useful in pharmaceutical composition for impairing growth of a solid tumour cell (e.g. human tumour cell) bearing an interleukin-13 receptor in a subject; for stimulating an immune response, which is expression of a cytokine (e.g. interferon gamma), particularly immunotherapeutic response against tumours or stimulating an in vivo or an in vitro immune cell, and for inducing an immune response against an infectious agent e.g. virus, bacteria and fungus. It is also useful for delivering oligodeoxynucleotides including a CyG motif in clinical applications; for treating infectious diseases (e.g. tularemia, malaria,
                                                                                                                                                                                                                                                                                                                                                                                                                                   Sterically stabilised cationic liposome; SSCL; ODN; oligodeoxynucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cationic liposome composition for delivering oligodeoxynucleotides including a CpG motif in clinical applications, comprises a cationic lipid, a co-lipid, stabilizing agent and an encapsulated oligonucleotide.

The present invention describes a method for inducing the production of vascular endothelial growth factor (VEGF) by a cell comprising contacting the cell with a CPG oligonucleotide and therefore inducing the production of VEGF by the cell. Also described: (1) inducing neovascularisation in a tissue, comprising introducing a CPG oligonucleotide into an area of the tissue, newhere the formation of new blood vessels is desired, and so inducing neovascularisation in the area of the tissue; (2) promoting angiogenesis in an area of the subject where angiogenesis is desired, omprising introducing a CPG oligonucleotide to the area, and so comprising introducing a CPG oligonucleotide to the area, and so comprising introducing a CPG oligonucleotide to the angiogenesis in the subject; and (3) screening for an agent that inhibits neovascularisation, comprisation administering the agent to the mammal, where inhibition of angiogenesis in the animal indicates that the mammal, where inhibiting neovascularisation. The CPG agent is effective in inhibiting neovascularisation. The CPG oligonucleotides have vulnerary, vasotropic and antiarteriosclerotic activities, and can be used in gene therapy. The method and the CPG
                                                                                                                                                                                                                                                             ö
francisella, schistosomiasis, tuberculosis and leishmaniasis), cancer (e.g. solid tumours, AIDS-associated Kapossi's tumour, thyroid cancer etc), allergy (e.g. eczema, allergic rhinitis or coryza, hay fever, bronchial or allergic asthma, urticaria, food allergies), autoimmune diseases (e.g. diabetes, rheumatoid arthritis, lupus erythematosus and multiple sclerosis) and psoriasis. The present sequence is a D class ODN potentially useful for encapsulating in SSCL.

oligonucleotides can be used in inducing angiogenesis or neovascularisation, such as in subjects with a skin graft, subjects who exhibit male pattern baldness, or subjects who have a wound or who have atherosclerosis or ischemia. The method may also be used in screening for agents that inhibit neovascularisation. The present sequence represents a CPG oligonucleotide which is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a method of increasing an immune response to opportunistic infection in an immunocompromised subject involves administering an immunostimulatory D oligodeoxynucleotide or an

cc immunostimulatory K oligodeoxynuclectide, where an antigenic epitope of a polypeptide is not administered to the subject. The method is useful for increasing an immune response to an opportunistic infection e.g. infection with a lentivirus such as human immunodeficiency virus (including HIV-1, HIV-2) e.g. AIDS; infection with Leishmania; bacterial infections; fungal infections; viral infections; protozoan infections; prion disease; and nucleoplasm in an immunocompromised subject or a subject infected with a lentivirus. The bacterial infections include subject infected with a lentivirus. The bacterial infections include cappergillosis, syphilis and neurosyphilis, tuberculosis and bacillary considenceds, the fungal infections include cryptosporialism, increased infections include cryptosporidiosis, concidiodomycosis, cryptococcal metringitis, hepatitis B, and toxoplasmosis, the protozoal infections include cryptosporidiosis, neumocystis carini; pneumonia and toxoplasmosis, viral hirry leukoplakis, neumocystis carini; pneumonia and contagiosum, oral hairy leukoplakia and progressive multifocal contagiosum, varal hairy leukoplasms include Kaposi's sarcoma, system contagiosum, caral hairy leukoplasms include Kaposi's sarcoma, system includes HSV, genital herpes Toster includes GC Hodgkin's lymphoma and primary central nervous system lymphoma. The horpes simplex includes HSV, genital herpes Toster includes GC and cervical cancer. The method stimulates immune responses to any opportunistic infection in immunocompromised subjects. This sequence that cervical inference multiple from a membral contagned and primary from the primary central mervous system and primary central nervous system includes from a membral primary central nervous system includes from and primary central nervous contagned and primary central nervous system proponses to any
